Twilio account setup for phone OTP login

A client-owned account for delivering AutoGuardian login codes to users in the Democratic Republic of the Congo (DRC).

Developer invitation email

muhammadrazawork59@gmail.com

Requested access: Developer, on the AutoGuardian account

The agreed approach

You own the Twilio account and manage payment. Your developer receives their own access and handles the SMS sender and Supabase Auth integration. Users receive an SMS code, then enter that code in AutoGuardian.

You, the client	Your developer
Create or select your account. Complete identity/business verification. Invite the developer. Approve and fund initial testing. Provide access to DRC test phones.	Confirm invited account access. Check DRC sender support and costs. Configure Twilio and Supabase. Test actual OTP login. Report delivery results and usage.

Follow this sequence

Create / select account > Invite developer

Confirm access > Upgrade / fund > Test OTP login

Account country and message destination are different

Use your real residence/business and billing details. If you are based in Morocco, use the applicable Moroccan details. DRC (+243) is the destination for app messages, not a substitute signup address.

This guide covers SMS phone login. Owner alerts, inbound SMS replies and USSD are separate integrations. Account approval, sender eligibility and delivery depend on Twilio and the destination networks.

CLIENT ACTIONS | ACCOUNT

1. Create or select your Twilio account

If you do not have an account

1. **Open the official signup page**

   Visit Twilio signup. Use an email address you control and a strong, unique password.

2. **Complete the signup checks**

   Verify your email and personal phone number. Use truthful residence/business information. Complete any identity or business checks Twilio requests.

3. **Describe the intended use**

   Choose SMS / Messaging where the onboarding offers a product choice. Explain that AutoGuardian uses transactional SMS codes for phone login, sent to users in DRC.

Suggested use-case description

AutoGuardian is a vehicle verification app. Users request an SMS one-time code to sign in using their phone number. Our destination market is the Democratic Republic of the Congo (+243). The messages are authentication codes, not marketing. An external developer will configure the integration.

4. **Secure and identify the account**

   Enable two-factor authentication for your Twilio login and retain your recovery information securely. Give the account an identifiable name such as AutoGuardian, where available.

If you already have an account

Sign in at Twilio Console. Select the account intended for AutoGuardian. Confirm you have Owner or Administrator access, check whether it is trial or paid, and resolve any account-verification or suspension notice. Reuse the account if suitable; avoid creating unnecessary duplicates.

If signup or verification fails

Keep the error message and contact Twilio Support. Provide the true use case and location. Do not replace your country or identity details to bypass a restriction. Your developer can help explain the technical requirements.

Next: invite the developer before committing significant funds. Source: Twilio signup and trial guidance.

CLIENT ACTIONS | ACCESS

2. Invite your developer

Use an account invitation for this external collaborator. A Gmail contractor address does not require you to verify ownership of the gmail.com domain.

Copy this address exactly

muhammadrazawork59@gmail.com

Role: Developer | Account: AutoGuardian

Current Twilio Console

1. Sign in and select the AutoGuardian account.
2. Open **Settings > Account settings > User management**.
3. Select **Invite users**.
4. Enter the email address above.
5. Select the **Developer** role for that account and confirm.

If you see the legacy Console

Open **Twilio Admin > Accounts**, select the account, open **Users**, then **Invite User**. Enter the email, choose **Developer**, and submit. Some legacy accounts expose this through **Account > Manage users**.

> **Keep ownership and billing with you**
>
> Developer access supports technical resources such as API credentials and senders. Keep your Owner role. Do not grant Administrator or Billing Manager access for this initial setup, and do not share your password, card details or login verification codes.

Confirm access before funding

Tell the developer the invitation was sent. They should accept using their own login, complete any required checks, and confirm that the AutoGuardian account is visible.

The developer is based in Pakistan and previously encountered signup problems. An invitation is the supported collaboration route, but it does not guarantee that Twilio will approve their login or verification. If blocked, contact Support before making a large deposit.

If invitation is unavailable while the account is on trial, ask Support whether upgrade is required; confirm the access path before paying. Menu names may vary. Sources: Twilio account invitations and Twilio Help Center.

CLIENT ACTIONS | BILLING

3. Upgrade and fund controlled testing

> **Why a Morocco trial is insufficient for DRC tests**
>
> Twilio currently restricts trial SMS to the signup country and verified recipients, with predefined content. A trial registered using a Moroccan phone cannot establish real AutoGuardian OTP delivery to DRC. Use a paid account for this cross-border integration. [1]

1. **Ask the developer to confirm the test plan**

   After access is confirmed, ask for the proposed DRC sender, current destination rates, any required fees, and a small test budget. Account credit alone does not establish delivery support.

2. **Upgrade if the account is still on trial**

   In the Console, select **Upgrade** / **Upgrade your account**, or search for Upgrade. Follow the pay-as-you-go flow, complete requested customer/identity information, and add your own billing details. [1, 2]

3. **Add a small initial balance**

   Use an amount permitted by the upgrade screen that fits the agreed testing budget. Review the charge before confirming. No fixed minimum or free-credit entitlement is promised by this guide.

4. **If the account is already paid**

   Check its available balance and payment status in Billing. Add funds only if necessary for the test budget. Use the existing paid account; no second upgrade is needed.

5. **Keep spending visible**

   Set low-balance and usage notifications where available. For initial testing, use manual top-ups where offered, or review any automatic recharge setting before confirming it. Usage alerts notify you; they are not a guaranteed hard spending cap.

What your payment covers

SMS charges depend on current DRC rates, message segments, resends, applicable network fees and any provisioned resources. Twilio credit pays for Twilio usage; it does not pay for Supabase hosting. Ask the developer before purchasing a phone number or additional product.

HANDOVER | DEVELOPER SETUP

4. Hand over configuration and test OTP login

Your final client checklist

- ☐ Your account is accessible and requested verification is complete.
- ☐ The invitation has been accepted with Developer access.
- ☐ The account is paid and has the agreed test balance.
- ☐ You confirm the app/brand name and approve the test budget.
- ☐ You arrange consenting testers with real DRC (+243) phones and identify their mobile networks.

You can now tell the developer: **"The account is ready. Please configure AutoGuardian SMS login and run the agreed DRC tests."** Invitation access replaces sending credentials in a message.

What the developer handles

1. **Sender:** create a Twilio Messaging Service and configure an eligible branded sender. AutoGuardian is a proposed sender name, subject to availability and applicable requirements. Twilio recommends an alphanumeric sender for DRC because numeric senders do not deliver to Airtel there. [3, 4]
2. **Destination:** enable DRC in SMS geographic permissions; enable other destinations only if needed. [5]
3. **Supabase:** configure the Phone Auth provider using Twilio Programmable Messaging, supplying the Account SID, Auth Token and Messaging Service SID required by that provider. Store secrets in trusted provider/server settings. Supabase access must be arranged separately if the developer does not already have it. [6]
4. **Login protection:** review OTP expiry, resend/rate limits, CAPTCHA or applicable abuse controls, and costs. Keep codes and credentials out of app logs and source code. [6]
5. **Acceptance:** test receipt on real DRC networks, successful sign-in, incorrect and expired codes, resends, and failed delivery. Review Twilio logs and confirm the cost of the test run.

> **OTP delivery uses one-way SMS**
>
> DRC does not support two-way SMS through Twilio. That does not prevent this login flow: the user enters the received code in the app. Twilio Verify is a separate provider option; this guide uses the existing Supabase + Twilio Messaging path. [3, 6]

Complete only when real DRC phones receive the codes and app sign-in succeeds. Sending accepted by an API alone is not proof of handset delivery.

HELP & REFERENCES

If something blocks setup

Problem	Next action
Signup / identity check fails	The client contacts Twilio Support with the exact error and actual business details.
Invitation does not arrive	Check the spelling and spam folder. Review pending invitations and resend if needed.
Developer cannot accept / sign in	Ask Support to confirm external Developer access from Pakistan. Funding does not guarantee access approval.
Billing or upgrade is blocked	The client resolves the payment/profile issue directly with Twilio.
DRC OTP is not delivered	The developer checks paid status, geographic permissions, sender eligibility, recipient format, network, logs and provider errors.

Suggested Support request

> We are setting up a client-owned Twilio account for AutoGuardian, using Supabase Auth and Twilio Programmable Messaging to send login OTPs to DRC (+243). Our external developer is based in Pakistan and should access this account with the Developer role using muhammadrazawork59@gmail.com. Please confirm the permitted invitation/login process, and help resolve the following error: [insert exact error].
